

Galapagos Islands, Evolution and Darwin

A Free Presentation

Charles Darwin spent five weeks in the Galapagos Islands in 1835 on his 5-year voyage around the world. The islands later became famous because he noticed the island's specialization of species and their adaptation to life on these islands.

Don Lawrence, a former biology and zoology teacher at CCHS, has visited the islands and will present his observations at the Sierra Club meeting on May 11th at 7:30 PM. Don will discuss the Galapagos Islands' unique plants and animals, emphasizing their evolution and their influence on Charles Darwin's Theory of Natural Selection.
